GIT QUEST | 30-DAY GIT LEARNING SERIES

Day 7: Week 1 Recap

Quiz and Cheat Sheet | Days 1 to 7

Created by Rutuja Naik

Week 1 complete!

In seven days you went from "What is Git?" to creating repositories, saving clear commits, reading your history and spotting every change. Today is a recap: a map of the week, one cheat sheet, a quiz and a final quest.

Day	Topic	One-line takeaway	Key commands
1	**Git vs GitHub**	Git saves your work. GitHub shares it.	git --version, git config
2	**git init + first commit**	Open a save slot, make a save point.	git init, git status, git commit
3	**The 3 areas**	Desk, packing table, cupboard.	git add, git commit, git restore --staged
4	**Add + good messages**	A commit message is the label on the box.	git add ., git commit -m
5	**git log**	Your time machine. HEAD = you are here.	git log --oneline, git show
6	**git diff**	Red pen = removed, green pen = added.	git diff, --staged, HEAD~1 HEAD
7	**Week 1 recap**	Put it all together.	Everything above

1. The whole workflow in one picture

`git restore --staged <file>` takes a file back off the packing table. These commands work alongside the flow:

Command	Answers the question
git status	Which area is each file in?
git diff	What did I change but not pack yet?
git diff --staged	What am I about to commit?
git log --oneline	What is my history?
git show <hash>	What is inside this one commit?

2. The daily loop

```
git status                  # 1. Where are my files?
git add <file>              # 2. Pack what belongs together
git diff --staged           # 3. Last check before saving
git commit -m "Add menu"    # 4. Seal it with a clear label
git log --oneline           # 5. Admire your history
```

3. Week 1 cheat sheet

Group	Command	What it does
Setup	git --version	Checks that Git is installed
	git config --global user.name "Name"	Tells Git who you are
	git init -b main	Creates a repository in this folder
Daily loop	git status	Shows which area each file is in
	git add <file> / git add .	Desk to packing table
	git commit -m "message"	Packing table to cupboard
	git commit -m "s" -m "body"	Commit with a longer note
Look around	git log --oneline	History, one line per commit
	git log --stat	History plus files touched
	git show <hash>	Opens one commit
	git diff	Desk vs packing table
	git diff --staged	Packing table vs cupboard
	git diff HEAD~1 HEAD	Compare the last two commits
Undo (so far)	git restore --staged <file>	Takes a file off the packing table

4. Boss quiz (10 questions)

1. What is the difference between Git and GitHub?
2. Which command turns a folder into a repository?
3. Name the 3 areas of Git.
4. Which command moves a file from the desk to the packing table?
5. What makes a good commit message?
6. What does HEAD mean?
7. Which command shows one line per commit?
8. In git diff, what does a line starting with + mean?
9. Which command shows what you are about to commit?
10. How do you leave the log screen when it opens?

Answer key

#	Answer
1	Git saves your work on your computer. GitHub is the website that stores and shares it.
2	git init
3	Working directory (desk), staging area (packing table), repository (cupboard).
4	git add
5	Short, starts with a verb, no full stop, one logical change.
6	The commit you are on: the "you are here" pin.
7	git log --oneline
8	The line was added.
9	git diff --staged
10	Press q.

5. Final quest: build it from scratch

In a fresh folder, without looking at the lessons:

```
$ git init -b main week1-final && cd week1-final
$ echo "One" > a.txt && echo "Two" > b.txt
$ git status
$ git add a.txt
$ git diff --staged
$ git commit -m "Add file a"
$ git add b.txt && git commit -m "Add file b"
$ git log --oneline
```

Success looks like: two commits, each with a clear message, and a log that reads like a short story.

6. Skills unlocked in Week 1

- Explain Git vs GitHub in one sentence
- Create a repository with git init
- Name the 3 areas and move files between them
- Stage one file, several files, or everything
- Write a clear commit message
- Read, search and zoom through your history
- Compare changes with git diff
- Run the daily loop without notes

Your Day 7 commit
File: `days-1-to-7-summary.md`
Message: `docs(day07): add week 1 recap summary`

Day	Week 2: Undo and Branch
8	.gitignore: tell Git which files to skip
9	git restore and git reset: oops, undo!
10	git commit --amend: fix your last commit
11	What is a branch?
12	git switch and git branch
13	git merge
14	Week 2 recap: Branch Adventure

Coming up: Day 8
.gitignore. Week 2 starts tomorrow. First stop: telling Git which files to ignore.
